SUMMARY

Full Stack Developer with **1+ year of production experience** building and shipping **REST APIs and web applications** across 2 startup environments. Strong focus on **backend development** — API design, data validation, and database performance — with end-to-end ownership from system design to deployment. Sole developer behind a **live platform currently serving 500+ users**.

EDUCATION

M.I.E.T

B.Tech, Computer Science and Engineering

Meerut

Aug. 2021 – May 2025

EXPERIENCE

Full Stack Developer

Mar 2025 – Present

EqasOnline

- Owned end-to-end backend for a **proficiency testing platform** used across multiple institutions — data model design, API structure, and validation logic from the ground up
- Shipped a **report generation module** using **Handlebars** that auto-produces formatted documents from test result data, eliminating a previously manual reporting process
- Designed a **data ingestion and validation pipeline** handling structured inputs from multiple sources with consistent integrity checks, consumed by both internal services and the React frontend

Backend Intern

Aug 2024 – Mar 2025

Dehix

- Node.js, Fastify, and TypeScript** backend — REST APIs with schema-level request validation, structured error handling, and consistent response contracts across all routes
- Cut response times on high-traffic endpoints by restructuring slow **MongoDB and PostgreSQL** aggregation pipelines and adding targeted indexes — most critical queries saw a noticeable drop in latency
- Wired up **OAuth 2.0 and Firebase** for secure, multi-provider user authentication — covers social login and token-based session management
- Worked closely with the frontend team across **a year of active releases**, maintaining stable API contracts while iterating on features tied to a React frontend
- Containerized services with **Docker** and set up **GitHub Actions** CI/CD — replaced fully manual deploys with an automated pipeline, removing human error from the release process

Founder & Full Stack Developer

Nov 2025 – Present

CityCore — Hyperlocal City Services Platform

Remote

- Sole developer behind a **live production platform serving 500+ users** — designed the system architecture, built the full stack, and shipped to production independently
- Node.js backend API running in production under real daily load — handles multi-service traffic with consistent response times and zero-downtime releases via Vercel's edge network
- Implemented **JWT authentication and role-based access control (RBAC)** across all routes, supporting distinct permission levels for different user types
- Architected a **modular, service-based backend** where each city service category is independently deployable — new service types can be onboarded without touching existing code

PROJECTS

Task Management System | Node.js, React, MongoDB, Express, Tailwind CSS

Live Demo

- Full-stack task tracking app with **JWT authentication** and **role-based access control** — supports multiple concurrent users with real-time task updates and persistent state across sessions
- Designed the data model to support multi-user task ownership and role separation at the schema level, keeping authorization logic out of application code

AutoFunds | React, Node.js, OpenAI GPT-4

Live Demo

- Personal finance app that uses **GPT-4** to parse plain-English expense inputs into **categorized budgets and savings recommendations** — no manual tagging or form-filling required
- Engineered the prompt layer and server-side parsing logic to reliably extract structured financial data from free-form user input, with fallback handling for ambiguous entries

TECHNICAL SKILLS

Languages: JavaScript (ES6+), TypeScript, Python, Java

Backend: Node.js, Express.js, Fastify, REST API Design

Frontend: React, Next.js, Tailwind CSS

Databases: MongoDB, PostgreSQL, MySQL

DevOps & Cloud: Docker, GitHub Actions (CI/CD), Vercel (Serverless/Edge), Firebase

Auth & Security: JWT, OAuth 2.0, Role-Based Access Control (RBAC)

Tools: Git, GitHub, Postman
